

The **UBC Innovation Support Unit** in collaboration with the **BC Centre on Substance Use** and the **Therapeutics Initiative** presents

Think Twice! The (lack of) evidence for opioid analgesics to treat minor acute and chronic pain

an educational webinar

This webinar will examine opioid sparing approaches in the context of primary care for non-cancer pain. Webinar attendees are invited to participate in an optional focus group discussion at the end of each webinar to discuss perceptions of opioid sparing pain management.

Learning Objectives:

- ✓ Describe and differentiate the evidence regarding opioid analgesia for serious acute injury vs. minor acute injury and chronic pain;
- ✓ Describe opioid sparing approaches;
- ✓ Assess the utility and limitations of risk prediction tools;
- ✓ Determine whether individuals at low risk of developing opioid use disorder can be reliably identified before prescribing opioid analgesics.
